## **DETAILED ACTION**

### ***Allowable Subject Matter***

Claims 2-6 are allowed.

The following is an examiner's statement of reasons for allowance: prior art does not teach nor render obvious an amplification circuit that has, in combination with other limitations, an input signal preservation unit includes: a bias resistor connected in parallel with an input terminal of the amplification device; and a reactor that is connected in series with the bias resistor and operates as an AC resistor and increases an input resistance value together with the bias resistor for thereby preventing a leakage of the AC input signal; nor does it have an output signal preservation unit includes: an amplification signal preservation part that includes a load resistor connected in parallel with an output terminal of the amplification device, and a first reactor that is connected in series with the load resistor and operates as an AC resistor and increases an output resistance value together with the load resistor for thereby preventing a leakage of the amplification output signal; and a voltage compensation unit that includes a second reactor connected in parallel with a connection point of the load resistor and the first reactor and operating as art AC resistor for thereby increasing an output resistance value together with the load resistor and preventing a leakage of the amplification output signal, and a condenser that is connected in series with the second reactor and compensates the voltage variation ratio of the amplification output signal.
